decade. For three successful plants the design process is described in detail and the rationale for each key design decision is explained. Numerical constraints are suggested for the sizing / selection parameters of key equipment items. Moreover, the application conditions under which the system selection is appropriate are discussed. By following The Guide for any of the three specific solar cooling systems, the designer can expect to reliably achieve a robust, energy-saving solution. This book is intended as a companion to the IEA Solar Cooling Handbook which provides a general overview of

the various technologies as well as comprehensive advice to enable engineers to design their own solar cooling system from first principles.

A Guide to Good Practice for Energy Efficient Installation of Residential Heating, Cooling & Air Conditioning Plant & Equipment 2004

Air-conditioning System Design Manual Walter T. Grondzik 2007 The Air Conditioning Manual assists entry-level engineers in the design of air-conditioning systems. It is also

usable - in conjunction with fundamental HVAC&R resource material - as a senior- or graduate-level text for a university course in HVAC system design. The manual was written to fill the void between theory and practice - to bridge the gap between real-world design practices and the theoretical calculations and analytical procedures or on the design of components. This second edition represents an update and revision of the manual. It now features the use of SI units throughout, updated references and the editing of many illustrations. * Helps engineers quickly come up with a design solution to a required

air conditioning system. *
Includes issues from comfort to
cooling load calculations. * New
sections on "Green HVAC"
systems deal with hot topic of
sustainable buildings.
