Landside | Airside Victor Marquez 2019-01-18 Why do we love and hate airports at the same time? Have you been a victim of tiresome walks, congestion, long lines, invasive pat-downs, eternal delays and so on?

Perhaps no other technological system has been challenged by continuously changing paradigms like airports. Think a minute on rail stations; think of how successful are the rail networks of the world in connecting nations, with just minimum security measures. Why aviation and airports are so radically different in this regard? In order to answer those questions the author embarks on a thorough revision of airport

history and airport planning that in the end builds up a new theory about how airports are formed from the outset. Within its journey from the early airfield to the newest hubs of today, Dr. Marquez identifies for the first time the Landside–Airside boundary as the single most important feature that shapes an airport. In this sense, his finding challenges the “historical linearity” that, until today, used to explain a century of airports. From both an analytical and theoretical S&TS stance, Dr. Marquez assures that it is only when airports needed to be fully reinvented (LaGuardia, Dulles and Tampa) when they become transparent and we may be able to understand their lack of technological stability.

Plunkett's Airline, Hotel & Travel Industry Almanac 2008 Plunkett Research Ltd 2007-09 The travel industry has been through exceptional upheaval and change. Plunkett's Airline, Hotel & Travel Industry Almanac will be your complete guide to this fascinating industry. After reeling from the effects of the September 11, 2001 tragedies, the travel business is now emerging as a more streamlined, efficient and focused industry. Railway Planning, Management, and Engineering V Profillidis 2022-09-05 In a rapidly changing world, with increasing competition in all sectors of transportation, railways are currently restructuring their planning, management, and technology. As commercial and pricing policies change and new methods of organization are introduced, a more entrepreneurial spirit is required. At the same time, new high-speed tracks are being constructed and old tracks are being renewed, magnetic levitation trains

are in operation, hyperloop systems are being planned, high-comfort rolling stock vehicles are being introduced, logistics and combined transport are being developed. Awareness of environmental issues and the search for greater safety attribute a new role to the railways within the transportation system. Meanwhile, methods of analysis have evolved significantly, principally due to computer applications, the internet revolution, satellite technologies, and artificial intelligence, all of which offer new ways of thinking about and addressing old problems. *Railway Planning, Management, and Engineering* aims to fulfill the need for a new scientific approach for railways. It is intended to be of use to railway planners, managers, economists, engineers, and students in engineering, transportation, economics, and management. The book is divided into three parts, which deal successively with planning, management, track, rolling stock, safety, and the environment.

Airline Operations and Management Gerald N. Cook 2017-02-03 *Airline Operations and Management: A Management Textbook* is a survey of the airline industry, mostly from a managerial perspective. It integrates and applies the fundamentals of several management disciplines, particularly economics, operations, marketing and finance, in developing the overview of the industry. The focus is on tactical, rather than strategic, management that is specialized or unique to the airline industry. The primary audiences

for this textbook are both senior and graduate students of airline management, but it should also be useful to entry and junior level airline managers and professionals seeking to expand their knowledge of the industry beyond their own functional area.

Managing Airports Anne Graham 2018-06-13 *Managing Airports* presents a comprehensive and cutting-edge insight into today's international airport industry. Approaching management topics from a strategic and commercial perspective, rather than from an operational and technical viewpoint, the book provides an innovative insight into the processes behind running a successful airport. This fifth edition has been fully revised and updated to reflect the many important developments in the management of airports including:

- New content on: evolving airline models and implications for airports, self-connection, digital marketing, sensor and beacon technology, policy decisions and economic benefits, and climate change adaptation.
- Updated and expanded content on: airport privatisation, economic regulation, technology within the terminal, non-aeronautical innovations, service quality and the passenger experience.
- New and updated international case studies to show recent issues and theory in practice.

Updated case studies from emerging economies such as China, India, and Brazil. Accessible and up-to-date, *Managing Airports* is ideal for students, lecturers and researchers of transport and tourism, and practitioners within

the air transport industry.

Airline Operations and Delay Management Cheng-Lung Wu 2016-03-23

Airline Operations and Delay Management fills a gap within the area of airline schedule planning by addressing the close relationships between network development, economic driving forces, schedule demands and operational complexity. The pursuit of robust airline scheduling and reliable airline operations is discussed in light of the future trends of airline scheduling and technology applications in airline operations. The book extensively explores the subject from the perspectives of airline economics, airline network development and airline scheduling practices. Many operational issues and problems are the inevitable consequences of airline network development and scheduling philosophy, so a wide perspective is essential to address airline operations in their proper context. The influence of airline network development on schedule

planning and operations driven by economic forces and relaxed regulations is thoroughly examined for different types of operations in aviation such as network carriers and low-cost carriers. The advantages and disadvantages of running different networks and schedules are discussed and illustrated with real airline examples. In addition, this book provides readers with various mathematical models for solving different issues in airline operations and delay management. Airline Operations and Delay Management is ideal for senior undergraduate students as an introductory book on airline operations. The more advanced materials included in this book regarding modeling airline operations are suitable for postgraduate students, advanced readers and professionals interested in modeling and solving airline operational problems.

Railway Management and Engineering V Profillidis 2017-11-30 In a rapidly changing world, with increasing competition in all sectors of transportation, railways are in a period of restructuring their management and technology. New methods of organization are introduced, commercial and tariff policies change radically, a more entrepreneurial spirit is required. At the same time, new high-speed tracks are being constructed and old tracks are renewed, high-comfort rolling stock vehicles are being introduced, logistics and combined transport are being developed. Awareness of environmental issues and search for greater safety give to the railways a new role within

the transportation system. Meanwhile, methods of analysis have significantly evolved, principally due to computer applications and new ways of thinking and approaching old problems. Therefore it becomes necessary to come up with a new scientific approach to tackle management and engineering aspects of railways, to understand in-depth the origins and inter-relationships of the various situations and phenomena and to suggest the appropriate methods and solutions to solve the various emerging problems. This book aims to cover the need for a new scientific approach for railways. It is written for railway managers, economists and engineers, consulting economists and engineers, students of schools of engineering, transportation and management. The book is divided into three distinct parts: Part A deals with the management of railways, Part B deals with the track and, Part C deals with rolling stock and environmental topics. Each chapter of the book contains the necessary theoretical analysis of the phenomena studied, the recommended solutions, applications, charts and design of the specific railway component. In this way, both the requirement for a theoretical analysis is met, and the need of the railway manager and engineer for tables, nomographs, regulations, etc. is satisfied. Railways in Europe have separated activities of infrastructure from those of operation. In other parts of the world, however, railways remain unified. The book addresses both situation. Railways

present great differences in their technologies. Something may be valid for one such technology, but not for another. To overcome this problem, regulations of the International Union of Railways (UIC) as well as European Standardization (CEN) have been used to the greatest extent possible. Whenever a specific technology or method is presented, the limits of its application are clearly emphasized.

Site Fights Daniel P. Aldrich 2011-03-15 One of the most vexing problems for governments is building controversial facilities that serve the needs of all citizens but have adverse consequences for host communities. Policymakers must decide not only where to locate often unwanted projects but also what methods to use when interacting with opposition groups. In *Site Fights*, Daniel P. Aldrich gathers quantitative evidence from close to five hundred municipalities across Japan to show that planners deliberately seek out acquiescent and unorganized communities for such facilities in order to minimize conflict. When protests arise over nuclear power plants, dams, and airports, agencies regularly rely on the coercive powers of the modern state, such as land expropriation and police repression. Only under pressure from civil society do policymakers move toward financial incentives and public relations campaigns. Through fieldwork and interviews with bureaucrats and activists, Aldrich illustrates these dynamics with case studies from Japan, France, and the United

States. The incidents highlighted in Site Fights stress the importance of developing engaged civil society even in the absence of crisis, thereby making communities both less attractive to planners of controversial projects and more effective at resisting future threats.

Protecting Airline Passengers in the Age of Terrorism Paul Seidenstat

2009 After 9/11, the United States opted for a higher level of security, especially for the transportation sector, since significant damage to the transportation infrastructure in the form of death and injury to passengers and, collaterally, damage to persons and property threatens to undermine the American economy and society. This work attempts to offer economic analysis techniques that would help in the formulation of air security policy and efficient management applications.

Towards Sustainable Aviation Paul Upham 2012-06-25

Aviation is integral to the global economy but it is also one of the main obstacles to environmentally sustainable development. It is one of the world's fastest growing - and most polluting - industries. What can be done to retain the economic and other benefits it brings, without the associated pollution, noise, congestion and loss of countryside? In this volume, industry, policy and research experts examine how to address the problems, and what it would take to achieve genuinely sustainable aviation - looking at technological, policy and demand-management options. Without far-

reaching changes the problems caused by aviation can only multiply and worsen. This work seeks to take an important step in diagnosing the problems and in pointing towards their solutions.

Paul Andreu Philip Jodidio 2004 Paul Andreu is well known for the more than 50 airports in Europe, Asia and Africa which he designed as head architect of the Aéroports de Paris, and for the Grande Arche de la Defense in Paris. The French Channel Tunnel terminal with the adjacent

CitÃ© Europe shopping centre is one of his recent European achievements. For several years Andreu has been increasingly active in the Far East, responsible not only for the airport of Shanghai and the Guangzhou Gymnasium, but also the Canton Sports Centre, the Osaka Maritime Museum and the Shanghai Oriental Arts Centre. In 2004 the Beijing Opera house, a futuristic dome in Tianarmen Square, will be opened, one of Andreu`s most spectacular projects and crowning achievements. The internationally renowned author Philip Jodido describes and documents the most influential stages of Andreu`s work.

The Management of Technological Innovation Mark Dodgson 2008-02-07

The management of technological innovation (MTI) is one of the most important challenges facing businesses today. Innovation has become the fundamental driver of competitiveness for firms of all sizes in virtually all business sectors and nations. The first edition of this book has become one of the most popular texts for students of innovation and technology management. This new edition sees David Gann and Ammon Salter join Mark Dodgson as authors, drawing on their combined experience of 60 years of researching and teaching MTI. It combines the most relevant theoretical analysis with contemporary and historical empirical evidence to provide a comprehensive, yet concise and readable, guide to the challenges of MTI. By explaining the innovation process the book reveals

the broad scope of MTI and its importance for company survival, growth and sustainability. It describes how MTI has to be managed strategically and how this is successfully achieved by formulating and implementing strategy and delivering value. Chapters provide frameworks, tools and techniques, and case studies on managing: innovation strategy, communities, and networks, R&D, design and new product and service development, operations and production, and commercialization. Based on robust analysis, the book provides a wide range of empirical evidence from a huge diversity of case studies, with around fifty case studies newly written for this edition. It analyses MTI in all parts of the world, in companies large and small, and in services, manufacturing, and resource-based business sectors. This new edition has been fully revised and updated to reflect the latest teaching and research, and to ensure its continuing relevance to the contemporary world of MTI. It will be an important resource for academics, students, and managers throughout the world, is a recommended text for students of innovation and technology management at postgraduate and undergraduate level, and is particularly valuable for MBA courses.

EU State Aid Control of Infrastructure Funding Corinne Ruechardt

2018-07-03 The elements of infrastructure – roads, transportation, electricity, water, communications, schools, hospitals – are so ingrained in

the fabric of daily life that few people give a second thought to who provides them, and how. Yet, they are controlled by an extensive and complex regulatory system. Moreover, the EU's State aid modernization plan has made infrastructure a crucial aspect of competition law. How did EU State aid law turn into regulation on whether a city can build a new airport, or how it may operate a school? And what do the rules actually mean for infrastructure funding? These are the questions this book, the first comprehensive guide to EU State aid law in this key sector and a major contribution to the debate on the topic, seeks to answer. In its thorough review of the legal literature as well as relevant legislation and case law, this book covers such aspects of the infrastructure-State aid nexus as the following: – role of infrastructure in competition law; – infrastructure funding as aid and its compatibility with the internal market; – impact on land development and other ongoing activities; – sector-specific impact of State aid regulation on the design of infrastructure projects; – risk management; and – newer infrastructure sectors such as sports and cultural and healthcare projects. At many points in the presentation, the case-by-case analysis provides individual appraisals. In addition to focusing on the complex rules and how they have been interpreted in the decisional practice of the Commission and in the EU case law, this book provides deeply informed proposals for reform. This is a key work in a field

of EU law that has developed and changed dramatically in recent years. It is sure to be of immeasurable value to practitioners and jurists in State aid law, competition law, and public procurement, as well as market actors (aid beneficiaries and competitors), policymakers, government officials, and business persons in these fields.

Managing Environmental Disputes P. Glasbergen 2012-12-06 The concept of sustainable development is a source of inspiration for many, who see it as a call to cooperative action. In practice, however, policies intended to further this goal often generate conflicts of interest. The ensuing disputes occur among governmental organizations, but disputes also arise between public authorities, private interest groups, and the environmental movement. In the opinion of the authors, the fact that environmental policy can provoke such conflict may be attributed largely to decision making procedures in our society. Accordingly, the authors are convinced that a new approach to managing environmental disputes is needed in order to deal effectively with environmental problems. Indeed, this book presents a viable alternative, which is called network management.

Managing Airline Networks Markus Franke 2020-12-29 Managing Airline Networks: Design, Integration and Innovative Technologies is a fully comprehensive description of state-of-the-art network management practices at airlines. Designed as a compendium on current practices and

future trends in the field, the book offers an instructive guide through the complex world of non-linear production systems. Written by a renowned consultant and aviation expert, the book discusses the impact of network management on airline resource planning and performance, and examines the interplay between network management and adjacent functions. The book includes a practical case study and is enriched with academic perspectives. Discussing upcoming trends in the sector, the book provides an outlook on advanced technologies that may play a role in next-generation network management. Features include: a description of basic network types, performance indicators for profitable networks, efficient processes and success factors for network management, and common optimisation models and tools; descriptive overviews, supported by practical examples, and leading to a deep-dive case study; a section on trends in network management, outlining new demand forecasting models, 'big data' applications, machine learning and AI use cases, and alternative optimisation models for airlines. *Managing Airline Networks: Design, Integration and Innovative Technologies* is designed as a comprehensive compendium and is essential reading for both aviation practitioners and students of airline management.

The Economics of Airport Operations James Peoples 2017-10-03 This volume examines the role that airports play in economic development and

land values, the regulation and economic efficiency of airports, airport pricing and competition, and the role played by airports in influencing airline operations and networks.

Managing the Unknown Christoph H. Loch 2011-11-30 *Managing the Unknown* offers a new way of looking at the problem of managing projects in novel and unknown environments. From Europe's leading business school, this book shows how to manage two fundamental approaches that, in combination, offer the possibility of coping with unforeseen influences that inevitably arise in novel projects: * Trial-and-Error Learning allows for redefining the plan and the project as the project unfolds * Selectionism pursues multiple, independent trials in order to pick the best one at the end *Managing the Unknown* offers expert guidelines to the specific project mindsets, infrastructures, and management methods required to use these project management approaches and achieve success in spite of unforeseen obstacles. This book equips readers with: * Causal explanations of why unforeseeable factors in novel projects make traditional project planning and project risk management insufficient * Directly applicable management tools that help managers to guide novel and high-uncertainty projects * Real-world case studies of both successful and unsuccessful approaches to managing high uncertainty in novel projects

AIR CRASH INVESTIGATIONS, FLYING COFFIN? The Near Crash of Olympic Airlines Flight OA202 Pete Collins, editor 2012-07-01 The Lockheed 1011 registered A6-BSM, operated by Star Jet and chartered by Olympic Airlines, arrived on 4 July 2005 at Terminal 1 at Paris Charles de Gaulle airport. Departure was delayed because the forward hold door could not be closed. A mechanic tried to close the door manually with a hammer and a chuck. Some passengers, worried about the apparent state of the cabin and the noise, asked to disembark, and this led to a mass movement. The airplane took finally off at 16h17. Shortly after departure the crew noticed problems with engine number 3. The captain requested the SEVERE DAMAGE procedure and returned to the airport. The French Bureau d'Enqu tes et d'Analyses pour la s curit de l'aviation civile (BEA) investigated the incident. BEA found out that the aircraft suffered from many problems, such as leaking fuel, malfunctioning safety features and lacking maintenance. The flight crew was not properly licensed, the captain was too old to fly in Europe. The Lockheed Tristar was a flying coffin.

Optimisation Du Trafic Aérien Dans de Grands Aéroports Ji Ma 2019 The air traffic growth induces congestion and flight delays both at the airports and in the surrounding airspaces. In fact, the airports are limited in terms of capacity and represent the major bottlenecks in the air traffic

management system. Efficient planning and control are critical to enhance the airport operation efficiency and to reduce flight delays. In prior research, several sub-problems associated with airport operations have already been discussed separately, such as runway scheduling, taxiway scheduling, terminal airspace management, etc. However, these operations are closely related and can affect each other. This motivates the development of an integrated optimization approach for managing air traffic at airport and in the surrounding airspace. In this thesis, we suggest a two-level optimization approach which works on both the macroscopic and the microscopic levels. Following the prediction horizon of different problems, we consider first a long term horizon with an abstract network of airport and TMA. Then, we consider a shorter horizon with a detailed network of airport components. In the first part of the thesis, we focus on the integrated optimization of airport operation problem and terminal airspace management problem at a macroscopic level. The airside is modeled as an abstract network: terminal, taxi network, and runway are seen as specific resources with a defined maximum capacity, and the TMA is modeled by a predefined route network structure. This level of abstraction aims at identifying the airport congestion situations. We develop an optimization model to minimize flight delays, resolve airspace conflicts, and mitigate airport congestions by controlling speed, arrival and

departure times, and assigned runway, while keeping various operational constraints. An adapted simulated annealing (SA) metaheuristic combined with a time decomposition approach is proposed to solve the corresponding problem. Computational experiments performed on case studies of Paris Charles De-Gaulle airport show potential improvements on airport congestion mitigation and flight delay reduction. The second part of the thesis deals with the airport runway and taxiway scheduling problem at a microscopic level. In this part, we represent the airport (gate, taxiway, runway) with a detailed surface node-link network, and we consider individual aircraft trajectories based on this graph. We aim at resolving the ground conflicts among aircraft, assigning the pushback times, the taxi speeds and the positions (runway threshold or holding point) and the holding times. The optimization model is designed to reduce runway queue length and minimize flight delays as well as taxi times with respect to safety concerns in surface traffic operations. A comparison with regard to baseline scenarios of the microscopic optimization benefits is presented for two major airports: Paris Charles De-Gaulle (CDG) airport and Charlotte Douglas International airport (CLT). Important gain in taxi time savings and runway queue length reduction are achieved, particularly at CLT since it is more prone to congestion.

The Airline Revolution Gordon Mills 2016-07-15 When starting new airlines

in response to government deregulation, entrepreneurs in the U.S. and Europe reduced some traditional service qualities (to reduce costs), concentrated on non-stop services between city pairs not already so connected, improved on-time performance, and offered low fares to win leisure travelers from the incumbents and to encourage more travel. In recent developments, some of the new airlines have offered optional extras (at higher fares) to attract business travelers and entered major routes alongside the legacy carriers. Within both the U.S. and Europe, deregulation removed most geographical barriers to expansion by short-haul airlines. Later, limited deregulation spread to other world regions, where many short-haul routes connect city pairs in different countries, and where governments have retained traditional two-country mechanisms restricting who may fly. To gain access to domestic routes in other countries, some new airlines are setting up affiliate companies in neighboring countries, with each company legally controlled in the country of domicile. With air travel growing strongly, especially in Asia, a common result is intense, but potentially short-lived, competition on major routes. The recent developments give clear signposts to likely mid-term outcomes, and make this an opportune time to report on the new-airline scene. The Airline Revolution will provide valuable economic analysis of this climate to students, airline professionals advancing to senior positions, public

servants and others who provide advice to governments.

Fundamentals of Air Transport Management Senguttuvan 2006 The rapid growth of the aviation industry, propelled by catalysts like Liberalization, Privatization and Globalization has in recent years given a major fillip to the global economy in terms of facilitating international trade, generating employment, foreign exchange earnings, and prosperity from tourism, industrial growth and technological development. The potential market for air transport has shown signs of a strong global resurgence, with the Asia Pacific region's performance far exceeding the world average growth&.with India and China being projected as the hottest growth sectors.The Indian aviation industry has shown impressive growth, contributing 1.0%, 8.0% and 69% share at the global, Asia Pacific and South Asian regional levels respectively. Key players such as Boeing, Airbus Industrie, ACI, IATA and ICAO envisage that India will touch 100 million passengers by 2010.

Meanwhile, the Indian Government has responded suitably, inter alia by encouraging private sector participation in the development of the civil aviation sector. Over ten chapters, this informative book elucidates all the concepts fundamental to the management of air transport, illuminating the

factors key to operational, infrastructural and public policy in the development of air transport.

Globalization and Human Resource Management in the Airline Industry

Jack Eaton 2017-03-02 Globalization is a pervasive feature of recent industrial and commercial developments, not least in the airline business with concomitant effects on human resource management. This book focuses on the organization and human resource changes that have taken place in the international airline industry in recent years. It provides an extensive analysis of airline organization and external relations, airline organization and internal relations, changes in industrial relations and human resource management and also, the integration of human resource management and other management functions. The authoritative second

edition of an already established work that covers both theory and practice, this book will be of great interest to managers in all areas of the airline industry, as well as to students of air transport and personnel/human resource management.

Planning the Impossible Eirini Kasioumi 2021-07-05 International airports have become an inherent part of many urban regions and key transport infrastructures for metropolitan economies. Yet they are also a source of tensions, often associated with the contrasting impacts of their operation. Taking the example of Charles de Gaulle airport (CDG) in Paris, the author analyzes the factors influencing urban development and the related spatial strategies. Step by step, she traces the history of the airport, examines prominent conflicts and their management by planners, and derives broader lessons. Intended for town planners, policy makers, and urban designers, the book makes an important contribution to understanding the challenges and assessing the effectiveness of planning approaches for airport regions.

EU Competition Law, Volume 5 Francisco Enrique Gonzalez-Diaz

2013-12-18 Article 102 of the Treaty on the Functioning of the European

Union, concerning the abuse of a dominant position, has probably never played a more prominent role in EU anti-trust policy than today. In 2009, there were high profile cases involving Microsoft, Intel, GDF Suez, and numerous others, and, at the end of 2008, the European Commission issued new guidance on enforcement priorities in applying Article 102 to abusive exclusionary conduct. In many respects, Article 102 represents probably the most rapidly evolving area of EU anti-trust law and provides for a much greater role in Community competition law enforcement for national competition authorities. This book gives a complete working guide to these new procedures, as well as a detailed examination of court jurisprudence in this complex and important area of law. It is an in-depth working guide to the application of Article 102 in practice, including the evolution in policy resulting from the important Commission Review and the economic approach to its application that is becoming the hallmark of recent Commission policy in this area. The book's contributors are leading authorities with wide experience within the European Commission and private practice.

European Air Traffic Management Andrew Cook 2016-12-05 European Air Traffic Management: Principles, Practice and Research is a single source of reference on the key subject areas of air traffic management in Europe. It brings together material that was previously unobtainable, hidden within technical documents or dispersed across disparate sources. With a broad cross-section of contributors from across the industry and academia, the book offers an effective treatment of the key issues in current, and

developing, European ATM. It explains the principles of air traffic management and its practical workings, bridging the academic and operational worlds to give an insight into this evolving field, with a number of fresh perspectives brought to the text. On-going research and developments are closely integrated into the themes, demonstrating the likely directions of future ATM in Europe and the challenges it will face. It is anticipated that many readers will already have expertise in one or more of the chapters' subject matter, but wish to develop a further understanding of the areas covered in others, taking advantage of the many thematic and operational links which have been illustrated. The book will appeal to both aviation academics and practitioners, equally for those whose area of expertise is outside ATM but want a clearly elucidated source of reference, as to those wishing to broaden existing knowledge.
